Re: Larger Sprocket for Dual Trolley and Side Mt Trolley Mounting Kits

---

The original 12T idler sprocket located at the rear of the optional dual trolley and side mount trolley slave track assemblies has been changed to a 28T sprocket in order to prevent the tensioning bolt from bending due to the chain angle. In order to accommodate the 28T sprocket, the pin connection of the spreader bracket was replaced with a bolted connection. This went into effect in manufacturing on 03/03/14.
